

Cloud Storage

Overview

This document is intended to provide a good summary of how data is stored within our cloud platform.

Architecture

Controls

You are in full control of when and how you upload data into the cloud. You can choose on a per device basis when you upload, how many days you wish to store and where (edge/cloud).

Classes

Classes are defined by many providers in different ways such as regional, multi-regional, archival etc. Our system abstracts this concern away from you. Today you have 2 options: Redundant or Geographically Redundant. Our pricing model is reflective cost effectiveness of storing data over time and currently is not available to our end customers to control.

Encryption

We utilize GCP's native encryption you can read more information here <https://cloud.google.com/docs/security/encryption/default-encryption>. Note we do not support BYOK (Bring your own key) concepts yet however we would like to offer this in our future.
